## INSTRUCTIONS

**GENERAL:** To be effectively filed with the Plant Variety Protection Office (PVPO), ALL of the following items must be received in the PVPO: (1) Completed application form signed by the owner; (2) completed Exhibits A, B, C, E; (3) at least 2,500 viable untreated seeds, or for tuber reproduced varieties verification that a viable (*in the sense that it will reproduce an entire plant*) tissue culture will be deposited and maintained in an approved public repository; (4) check drawn on a U.S. bank for \$2,450 (\$300 filing fee and \$2,150 examination fee), payable to "Treasurer of the United States" (*See Section 97.6 of the Regulations and Rules of Practice.*) Partial applications will be held in the PVPO for not more than 90 days, then returned to the applicant as unfilled. Mail application and other requirements to Plant Variety Protection Office, AMS, USDA, Room 500, NAL Building, 10301 Baltimore Blvd., Beltsville, MD 20705-2351. Retain one copy for your files. All items on the face of the application are self explanatory unless noted below. Corrections on the application form and exhibits must be initialed and dated. **DO NOT** use masking materials to make corrections. If a certificate is allowed, you will be requested to send a check payable to "Treasurer of the United States" in the amount of \$300 for issuance of the Certificate.

### ITEM

- 16a. Give: (1) the genealogy, including public and commercial varieties, lines, or clones used, and the breeding method;
- (2) the details of subsequent stages of selection and multiplication;
- (3) evidence of uniformity and stability; and
- (4) the type and frequency of variants during reproduction and multiplication and state how these variants may be identified.
- 16b. Give a summary of the variety's distinctness. Clearly state how this application variety may be distinguished from all other varieties in the same crop. If the new variety is most similar to one variety or a group of related varieties:
- (1) identify these varieties and state all differences objectively;
- (2) attach statistical data for characters expressed numerically and demonstrate that these are clear differences;
- (3) submit, if helpful, seed and plant specimens or photographs (prints) of seed and plant comparisons which clearly indicate distinctness.
- 16c. Exhibit C forms are available from the PVPO for most crops; specify crop kind. Fill in Exhibit C (Objective Description of Variety) form as completely as possible to describe your variety.
- 16d. Optional additional characteristics and/or photographs. Describe any additional characteristics that cannot be accurately conveyed in Exhibit C. Use comparative varieties as is necessary to reveal more accurately the characteristics that are difficult to describe, such as plant habit, plant color, disease resistance, etc.
- 16e. Section 52(5) of the Act requires applicants to furnish a statement of the basis of the applicant's ownership. An Exhibit E form is available from the PVPO.
17. If "Yes" is specified (*seed of this variety be sold by variety name only, as a class of certified seed*), the applicant may NOT reverse this affirmative decision after the variety has been sold and so labelled, the decision published, or the certificate issued. However, if "No" has been specified, the applicant may change the choice. (*See Regulations and Rules of Practice, Section 97.103*).
20. See Sections 41, 42, and 43 of the Act and Section 97.5 of the regulations for eligibility requirements.

**NOTES:** It is the responsibility of the applicant/owner to keep the PVPO informed of any changes of address or change of ownership or assignment during the life of the application/certificate. There is no charge for filing a change of address. The fee for filing a change of ownership or assignment is specified in Section 97.175 of the regulations. (*See Section 101 of the Act, and Sections 97.130, 97.131, 97.175(h) of Regulations and Rules of Practice.*)

To avoid conflict with other variety names in use, the applicant should check the variety names proposed by contacting: Seed Branch, AMS, USDA, Room 213, Building 306, Beltsville Agricultural Research Center-East, Beltsville, MD 20705.  
Telephone: (301) 504-8089.

## **Penn A-2**

### **Origin and Breeding History of Penn A-1, A-2, A-4, G-1, G-2, G-6**

The objective of this varietal breeding program was to develop creeping bentgrasses exhibiting superior putting green turf over existing varieties. Original parental material was selected from segregated patches of bent, 12 to 18 inches in diameter, on some greens at the Augusta National Golf Club, Augusta, Georgia in the spring of 1984. These segregates attracted attention because they were vigorous and dense, very fine textured, and had a more upright growth habit of individual plant tillers. The growth habit was unique because the selected segregates did not spike (raise up) from golfer's metal-spiked golf shoes. Their ability to spread at a closer than normal height of cut used for fast greens was also indicative of potential heat tolerance in a hot, humid golf course environment. The value of non-spikeing features was proven in subsequent years by the banning of golf shoes with metal spikes on most American golf courses, except for professional tournaments.

There were two groups of selections by the breeder, the 'G' and 'A' series. There were eight 'G' selections (G-1 to G-8) from two greens on the Par 3 course originally seeded to Penneagle creeping bent, and six selections (A-1 to A-6) from four greens on the main course originally seeded to Penncross creeping bent.

The breeding method used was a polycross procedure. The single parent selection of Penn A-2 was crossed with experimental selections of Penn G followed by two generations of crossing selected sib plants of Penn A-2.

Both 'G' and 'A' series selections were cloned into eight plants, pot planted, and induced to flower in growth chambers for six weeks. Isolated crossing blocks were established in the greenhouse for each 'G' and 'A' line in December 1984. Due to near self-sterility of bent, 'A' line plants were used as male crossing parents for 'G' lines, and conversely, 'G' plants used as male parents for the 'A' lines. Seed was produced from all crosses in March. Next 250 plants from bulk seed of each 14 lines (G-1, G-2, G-3, G-4, G-5, G-6, G-7, G-8 and A-1, A-2, A-3, A-4, A-5, and A-6) were nursery space planted in isolated field blocks in August 1985.

The first cycle of reselection began in the spring of 1986. First plants to be chemically rogued were those lacking in vigor coming out of winter. Majority of plants had a more upright growth with short stolons in keeping with their putting green selections. There were a few semi-decumbent types with longer stolons and dense ball types. The emphasis was on selecting the most uniform in upright growth habit, vigor, and uniformity in pre-anthesis flowering. On this basis, 30 to 50 plants were selected from each block of A-1, A-2, A-4, G-1, G-2, and G-6. All other 'A' and 'G' lines were discarded due to a combination of segregation and lack of vigor uniformity.

Seed was harvested from selected lines (G-1, G-2, G-6, A-1, A-2, and A-4) and used for small turf plots which confirmed the fine, dense qualities of original parents. The

selected clones of the first cycle were pot planted, cloned, and again induced to flower in growth chambers to save a year. Plants of each line were in isolated greenhouse crossing blocks. Crossing in this cycle was confined to the siblings of each line with no other pollen source. From the crossed plants of each line, 300 seedlings were grown for field planting for the next cycle of reselection in 1987.

The second cycle of reselection in 1987 consisted of arbitrarily selecting 40 to 50 plants as a reasonable number to work with and with the main criterion of selecting an upright growth habit eliminating all but very short stolon types, uniformity of size and vigor, and flowering. Confining the pollen source in this crossing within the A-2 parents resulted in increasing the population of desired growth habit types and reducing the longer stolon types to a few. Most of the "off-types" were limited to the dense ball types with few flowering heads.

Forty clones of each G and A were recloned to three plants and sent to Oregon for further evaluation and reselection under production state conditions where growth is more robust than in Pennsylvania and where commercial production would eventually take place. Following observations, 20 clones each were selected as potential Breeders parents. Seed of each G and A line was used to plant half acre observation, seed yields, and management trials. Satisfactory uniformity and stability of the G and A bent varieties from Oregon grown first generation seed was ascertained by inspection in both the vegetative and flowering stages of growth by the breeder, pure seed testing personnel, and Oregon certification. Variants consisted of a few more spreading decumbent types and the non-spreading ball types. The decumbent type seed heads protrude laterally at plant perimeters and the ball types produce few or no flowers. The decumbent variants for A-2 were calculated to constitute 0.12% based on 36 plants per half acre of an estimated population of 39,000 plants.

By agreement with the Bentgrass Growers Association with proprietary rights, all observed variants shall be chemically rogued to maintain varietal purity and stability in order to maintain a certified stand life of five seed yield years. To further maintain varietal purity, the commercial production of Penn G and A bents shall be limited to a two generation system, Breeder and Certified; the only varieties limited to only two generations.

Three cycles of five year stands of commercial plantings have shown that Penn A-2 is a uniform and stable variety to the satisfaction of the breeder and Oregon Certification with no further reselection deemed necessary.

Breeder seeds of Penn A-2 has been maintained and produced by Pure Seed Testing in Hubbard Oregon since 1994. Approval of the variety name has been cleared by the Seed Branch on May 21, 2003.

### Variety Distinction of Penn A-2

A PVP nursery was established at University Park, Pennsylvania in 1994 consisting of 21 creeping bent varieties with three replications of 25 spaced plants. Included were Penn A-2, plus six new Penn State varietal releases Penn G-1, G-2, G-6, A-1, A-4, Seaside II, and 13 commercial varieties. Data were collected in 1995 as shown in Table 1. This nursery was discarded due to loss of land.

A second PVP nursery was established at the Pure Seed Testing Research Farm near Hubbard, Oregon in 1995. The purpose was to evaluate plants in the location of major bentgrass commercial production where growth greatly exceeds the environment in the Northeast. It consisted of the above experimentals and 12 commercial varieties with four replications of 25 spaced plants. This test was maintained and data collected and analyzed by Pure Seed personnel after the original application for PVP. These data are shown in Tables 2 and 3. Varieties significantly different by years from Penn A-2 are summarized in Table 4. In this form, the most obvious differences and similarities are easily discerned.

Penn A-2 may be most easily distinguished from other bentgrass varieties tested predominately by plant height, base spread, panicle length, flag leaf length, and flag leaf width. It is most closely related to Penn A-1. Differences appear to be the following:

<u>Characteristic</u>	<u>Penn A-2</u>	<u>vs</u>	<u>Penn A-1</u>
Ligule percent shape at apex	20 acute 80 truncate		80 acute 20 truncate
Panicle percent anthocyanin	70 present 30 absent		100 absent

### **Additional Description of Penn A-2**

Penn A-2 is a very fine leaf textured and dense turfgrass. In spaced plant morphology it is most similar to the commercial variety Lopez and similar to Penn A-1, Penn G-1, and Penn G-2.

In tuft texture it is similar to the above Penn A and G varieties (Table 5).

Turf density is shown in two years for shoot density/dm<sup>2</sup> in Georgia (Table 6) and turf density in Florida for three years (Table 7).

Turf qualities superior to closely related Lopez are demonstrated in North Carolina in 1992 (Table 8) and 1999 and 2000 (Table 9), in Chicago (Table 10), and Oregon (Table 11).

Relatively low levels of anthocyanin purpling under cold and frost conditions were demonstrated in Georgia (Table 12).

This rating was taken on turf evaluation test mowed at putting green management height.
